Signal diagram

The subsequent circuit generates a request pulse via the INIT line. The position sensor responds with a START and a STOP signal.

To calculate the position value the time interval $t_{(x)}$ must be multiplied with the conversion factor v_s specified on the type label.

$$\text{Position value } x = t_{(x)} \cdot v_s$$

When using multiple magnets every single magnet generates its own STOP signal. To identify the single magnets definitely the distance between two magnets must be min. 70 mm.

POSICHRON® Output Specification SSI

Description

The data transmission takes place by means of the two signals CLOCK and DATA. The processing unit (PLC, microcomputer) sends pulse sequences which clock the data transmission at the required transfer rate. With the first falling edge of the pulse sequence the position of the sensor is recorded and stored. The following rising edges control the bit-by-bit transfer of the data word. After a delay time the next new position information can be transmitted.

Data format (Train of 26 pulses)

Synchronous serial interface SSI

Output	RS422
Excitation voltage	18 ... 27 V DC, residual ripple 10 mV _{SS}
Excitation current	Typ. 80 mA, 150 mA max.

Code	Gray code, dual code
Resolution	≥ 5 μm
Delay between pulse trains	>25 μs

Signal diagram

Cable length	Baud rate
50 m	100-1000 kHz
